We claim:

Add 23 >

- 1) A playing card dispenser comprising in combination:
a rotatably mounted storage means having a plurality of compartments for holding said playing cards,
first means for inserting discards into selected ones of said compartments,
second means for extracting cards to be dealt from said selected compartments, and
electronic logic means for randomly controlling one of said first and second means so that said playing cards are effectively being shuffled continuously by the random insertion or extraction from said storage means.
- 2) A computerized card shuffling device comprising in combination:
a card feeding means for feeding cards therefrom and thereto; a card transfer means including a plurality of card-receiving stations; and shifting means for matching any one of said plurality of stations with said card feeding means, said card feeding means being actuatable when said shifting means has matched any one of said plurality with said card feeding means.
